Data Science Project Week 4

Introduction

This is capstone project for IBM Data Science Professional Certificate. In this project, I am creating a hypothetical scenario for a concept that there may not be enough Chinese Restaurants in Toronto Area. Therefore it might be a great opportunity for an entrepreneur who is based in Canada. As the Chinese food is popular among Asian community, so this entrepreneur might think of opening its business in areas where Asian community resides. With the purpose in mind, finding the location to open such a restaurant is one of the most important decisions for this entrepreneur and I am designing this project to help him find the most suitable location.

Problem Analysis

The objective of this capstone project is to find the most suitable location for the entrepreneur to open a new Chinese Restaurant in Toronto, Canada. By using data science methods and tools along with machine learning algorithms such as clustering, this project aims to provide solutions to answer the business question: In Toronto, if an entrepreneur wants to open a Chinese Restaurant, where should they consider opening it?

Target Audience

The entrepreneur who wants to find the location to open authentic Chinese restaurant.

Data

To solve this problem, we will need below data:

● List of neighborhoods in Toronto, Canada

● Latitude and Longitude of these neighborhoods

● Venue data related to Chinese restaurants. This will help us find the neighborhoods that are more suitable to open a Chinese Restaurant.
